

Sprint 4

Aim:

The main goal of this Sprint 4 is to generate messages according to various situations.

Situation 1:

In the event that elderly individuals forget to take their medicines on time, their health condition can worsen or become harder to treat, or they may experience unpleasant side effects or complications.

Situation 2:

It is important to know whether the information is conveyed to the caretaker or not in case of an emergency

Explanation:

Situation 1:

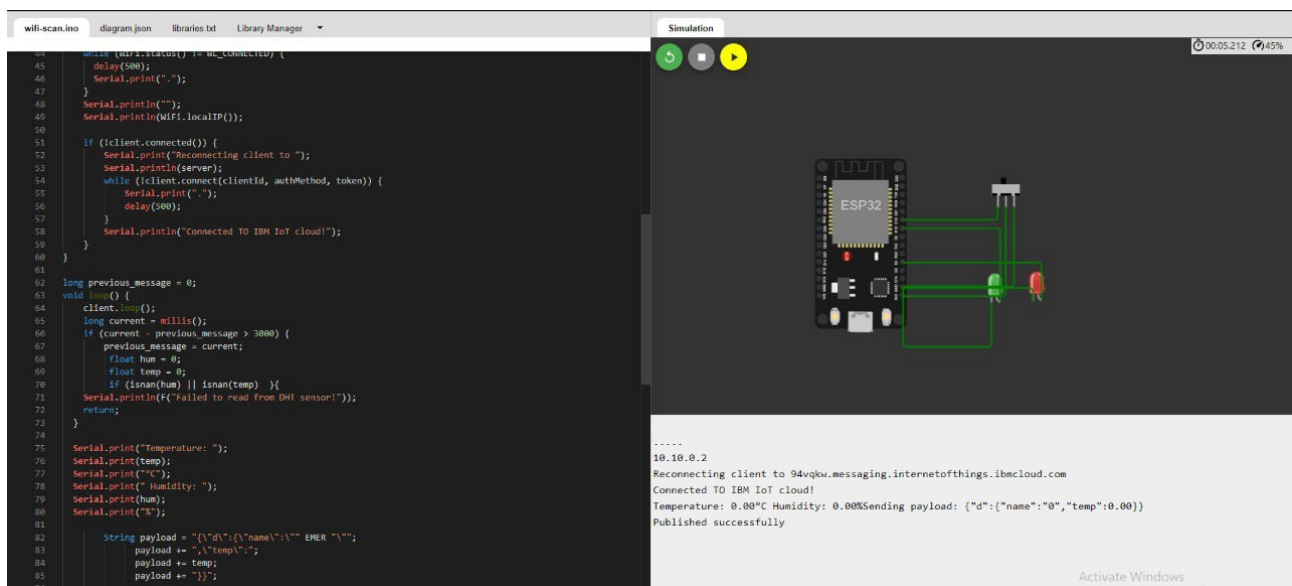

Busy life makes a lot of things forgotten in daily life. Elderly and chronically ill patients who need to take their medicines on time and cannot miss them, suffer from dementia and forget things in their daily life. If the patient suffers from a disease that must be taken in time.

Situation 2:

In an emergency, the elderly need the help of a caregiver. At this point, the caregiver must be notified via a notification.

Situation 1:

We need to send API get request to elderly people. The elderly people get notified and need to update the status of whether they have taken the medicine or not. The further process will continue based on their response.

Situation 2:

If they have not taken the medicine, the caretaker must be notified through message.
